Title : Some Problems of Recovery of the Gas Associated with Petroleum at the Fields of Tatneft Federation.

Orig Pub : Tr. Vses. n.-i. in-t prirod. gazov, 1957, No 1(9), 3-9

Abstract : The problems considered are those of recovery and transport of the gas at the fields, uninterrupted operation of the pumping system, and of maximum retention, in the gas, of the gasoline which is separated at the gasoline recovery plant.

TITLE: On the Pressure Conditions in a Gas Conduit as It Fills up With Gas (O rezhime davleniy v gazoprovode pri zapolnenii yego gazom)

PERIODICAL: Tr. Vses. n.-i. in-t prirod. gazov, 1957, Nr 1(9), pp 10-16

ABSTRACT: It is pointed out that in a gas main in the process of being filled with gas the pressure in it increases as a function of the quantity of gas  $Q$  being pumped in, the length and diameter of the conduit, and the time  $t$ . It is stated that there are two possible ways of filling a gas conduit with gas: 1) the gas is fed into an empty conduit or into one in which atmospheric pressure prevails; 2) the gas is fed into a conduit which is already filled with gas and in which the prevailing pressure is greater than that of the atmosphere. The first case has been theoretically examined by Ribaud (Ribaud, G., C.r. Acad. sci., 1951, Vol 233; 1952, Vol 234), who from the equations of motion and continuity obtained the following formulae for the pressure  $P_x$  and the gas flow rate  $Q_x$  along the conduit during the filling operation:

Card 1/2

SOV/124-58-7-7543

On the Pressure Conditions in a Gas Conduit as It Fills up With Gas

$$P_x = P \sqrt[3]{t} F(axt^{-2/3}), \quad Q_x = Q \varphi(axt^{-2/3}),$$

wherein  $x$  is the distance from the starting point to the conduit section under study,  $t$  is the time elapsed,  $P_x$  and  $P$  are the pressures,  $Q_x$  and  $Q$  are the gas flow rates,  $a$  is a coefficient, and  $F$  and  $\varphi$  are certain functions. When simplifying assumptions are made with respect to the functions  $F$  and  $\varphi$ , and when certain other assumptions are adopted, engineering formulae are evolved which determine the quantity of gas passing through any section of the conduit at a given moment and the pressure at any point in the conduit. Examples of calculations are examined. The fact is mentioned that an experimental test made in the Kokhtla-Yarve-to-Tallin conduit showed a satisfactory agreement between calculated and observed pressures. A similar comparison of the observed gas volumes traversing given sections of the conduit with the calculated volumes was not made.

РЕЗЮМЕ: This collection of articles is intended for scientists, engineers, and technicians associated with the gas industry.

СОДЕРЖАНИЕ: The articles discuss the development of gas fields, natural gas recovery, gas transportation, and submarine gas conservation. Gas field operating conditions are analyzed from the commercial point of view. The author notes that due to the specific geological conditions prevailing in the Soviet Union the application of gas extraction methods of the type used in the USA is not always advantageous. Individual articles discuss problems of the development of gas fields with narrow oil containing fringes, the theory of gas inflow, the study of gas well performance, gas filtration dynamics, and the study of gas condensation. A number of articles are devoted to the study of stabilized gas flow in pipelines, and discuss theoretical problems connected with the performance of gas ejectors and compressors. The author also deals with corrosion of the inner surfaces of pipelines. Calculations made by the author are supported by analytical calculations. No permission is granted to reproduce any part of this article.

Title : Deep Plowing Without the Moldboard for Corn and Sunflower

Orig Pub : Zemledeliye, 1956, No 9, 73-76

Abstract : The experiment was conducted in the Institute of Agriculture of the Central Chernozem Belt imeni V.V. Dokuchayev in 1954 on an 8-field rotation. The experiment was organized as follows: (1) one surface plowing and then a moldboard plowing with the coulter set at 25-27 cm., (2) two surface plowings and a plowing without the moldboard and at a depth of 25-40 cm., using 5K-35 plows with both the coulter and the moldboard removed. In 1955 Voronezhskaya

Abstract: taken (35 X 35) to a depth of 50 cm in the period before the formation of suckers in the corn and before the formation of anthodia in the sunflower and then to a depth of 1 m during flowering of the plants. The active part of the root systems was determined by the Kolosov method (by absorption of methylene blue). The most active-absorption capacity of the root system both in corn and in sunflower was with blade-grader plowing with a sub-soiler. Such cultivation of the soil assured the obtaining of highest harvests of these crops. The increase in harvest of corn and sunflower with plowing without a blade grader in comparison with plowing with a blade grader at 27 cm was achieved by means of increasing the depth of cultivation.

1250. SYNTHOMYCIN THERAPY IN INFLAMMATORY DISEASES OF THE CORNEA (Russian text) - Khodarev N. N. - VESTN. OPTALM. 1958, 71 (38-43)

The author studied the therapeutic effect of synthomycin in 141 patients with ulcers of the cornea, and superficial and herpetic keratides. Simultaneously, he carried out determinations of the periods needed for disappearance of pathogenic microflora in cultures from the conjunctiva of patients treated with synthomycin. A comparative study of the effects of synthomycin, penicillin and albucid on the pathogenic microflora in vitro was also conducted. The results of this work demonstrated that synthomycin, when used locally in 0.3% solution or 1% emulsion (in grave forms, also per os), is a highly effective drug for treatment of corneal ulcers and keratitides. Synthomycin therapy quickly arrested the disease in 135 patients, including 23 patients of the 25 with herpetic keratitis. Synthomycin had a more pronounced bacteriostatic effect than albucid or penicillin, in experiments in vitro. Comparison of results obtained by the author with data on treatment of analogous diseases in 173 further patients (obtained from the files), demonstrated that synthomycin de-

TITLE: First results of an important experiment [Preliminary evaluation of Zond-3 moon photos]

SOURCE: Priroda, no. 9, 1965, II-IV

TOPIC TAGS: moon, Zond-3, lunar topography, selenology, moon far side, lunar probe, lunar surface, selenography

ABSTRACT: A preliminary evaluation is given of the photographs of the far side of the moon obtained by Zond-3. The following observations are based on statements made by M. V. Keldysh, A. I. Lebedinskiy, Yu. K. Khodarev, and A. G. Masevich at a press conference held on 23 August 1965. Spectra of the lunar surface were photographed in the 3500-2500-Å wavelength range, and spectrophotometry was carried out in the ultraviolet range from 2700 to 1900 Å and in the infrared from 4 to 3 microns. The probe employed a specially devised small-size phototelevision system that ensured protection of the film against cosmic radiation. The camera had an objective with a focal length of 106.4 mm and a relative aperture of 1:8. Special film 25 mm in width and exposure times of 1/100 and 1/300 sec were used. The photographs were ex-

AUTHOR: Abinder, A. A.; Khodas, M. Ya.

TITLE: Effect of central nervous system electroshock on oxygen tension and pH of brain tissue

SOURCE: Fiziologicheskii zhurnal SSSR, v. 50, no. 2, 1964, 183-186

TOPIC TAGS: cerebral electroshock, oxygen tension, brain tissue pH, brain blood circulation, respiration volume, brain oxidation process

ABSTRACT: The effect of electroshock on oxygen tension, pH, local blood circulation change in the brain, and respiration volume were investigated separately in three groups of guinea pigs. Animals were trepanned and subjected to square impulses (1.5 to 3.5 ma 40 cps) for 10 to 15 sec with 25 to 30 sec intervals for long duration electroshock (6 min) and short duration electroshock (2 min). Oxygen intensity was measured using a pair of electrodes and a RO-4 polarograph, pH was measured using an antimony electrode and a pH meter, and local blood circulation was recorded by a needle thermal pickup. Respiratory musculature mechanograms were recorded by a piezopickup and respiratory volume change was recorded by a photo-

Card 1/2

ACCESSION NR: AP4017132

pickup system devised by V. G. Filiminov (1962). Results show that with cerebral brain electroshock oxygen tension decreases for a short period and then steadily increases depending on intensity and duration of electroshock. Brain tissue pH shifts into the alkaline range with short duration electroshock and into the acid range with long duration electroshock. Local blood circulation in the brain is temporarily reduced by electroshock and is restored to normal after 9 to 12 min. Respiration volume decreases with long duration electroshock and increases with short duration electroshock. Oxygen tension increase under electroshock conditions may be attributed to depressed oxidation processes in brain tissue. Orig. art. has: 2 tables and 1 figure.
